DEVELOPING SUSTAINABLE HYDROGRAPHY IN AFRICA

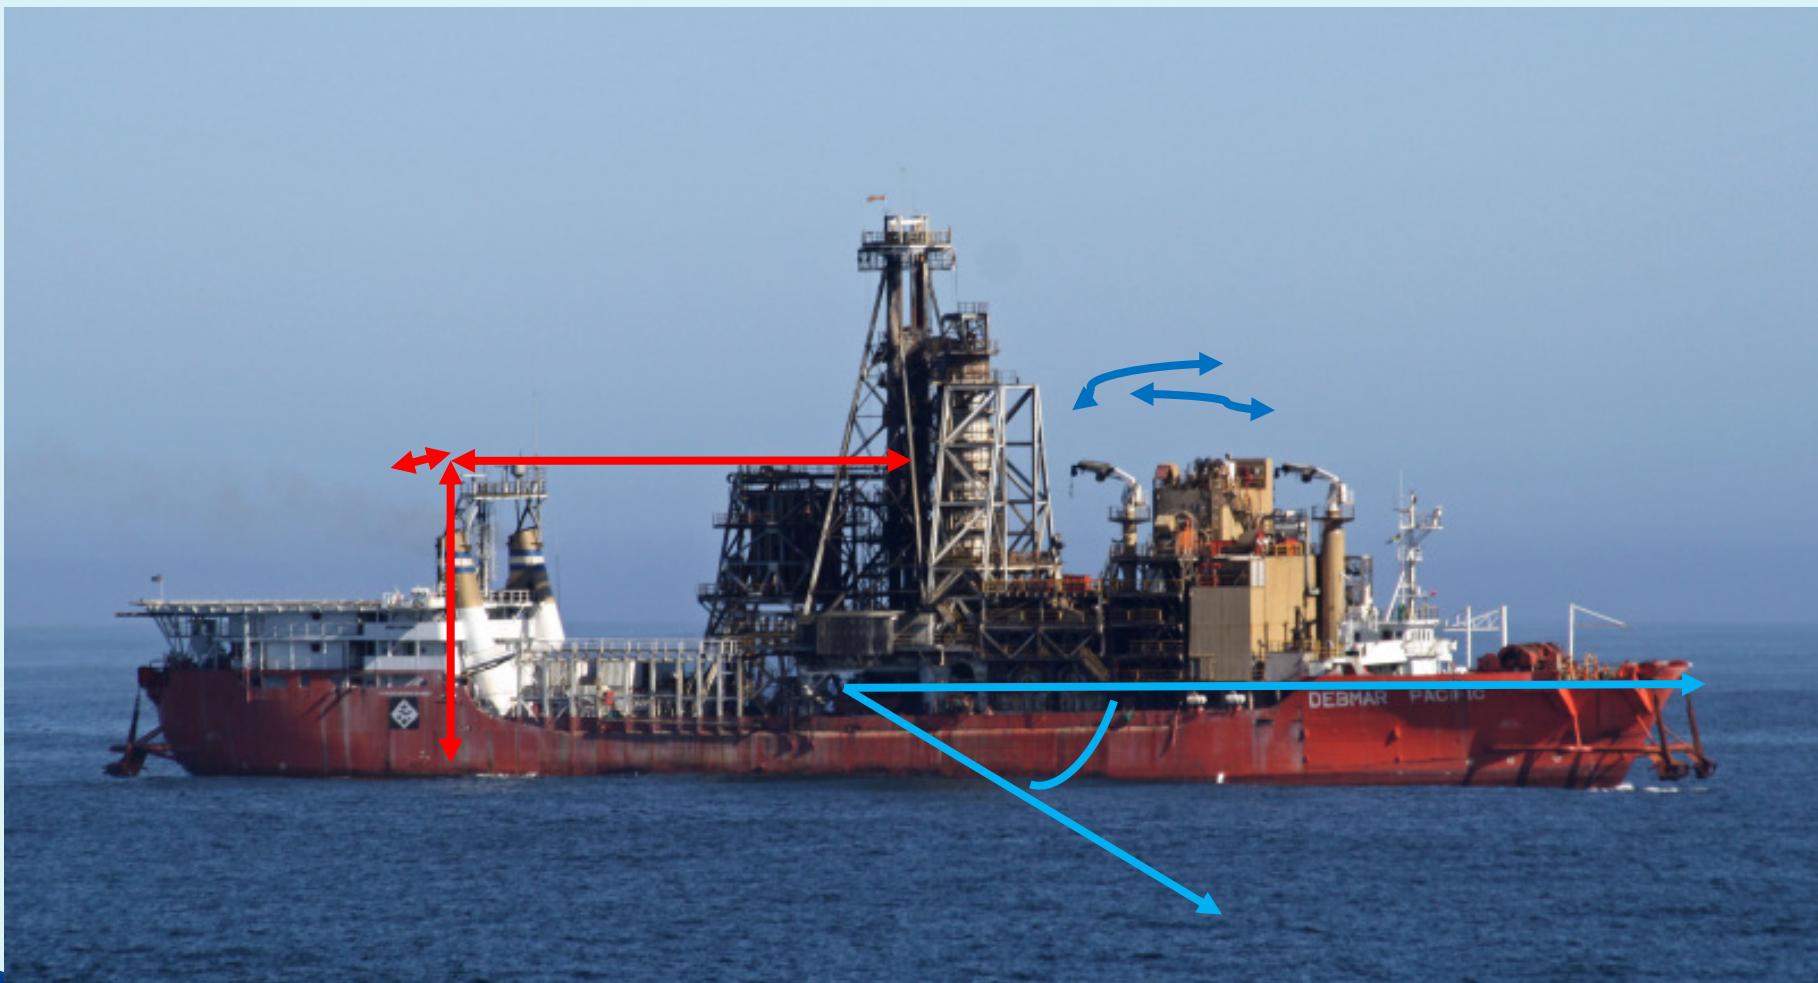

Case study - the error budget of the positioning equipment for a sea mining vessel

C. Jendrissek

Debmarine Namibia
Namibia

How precisely must all this be known?

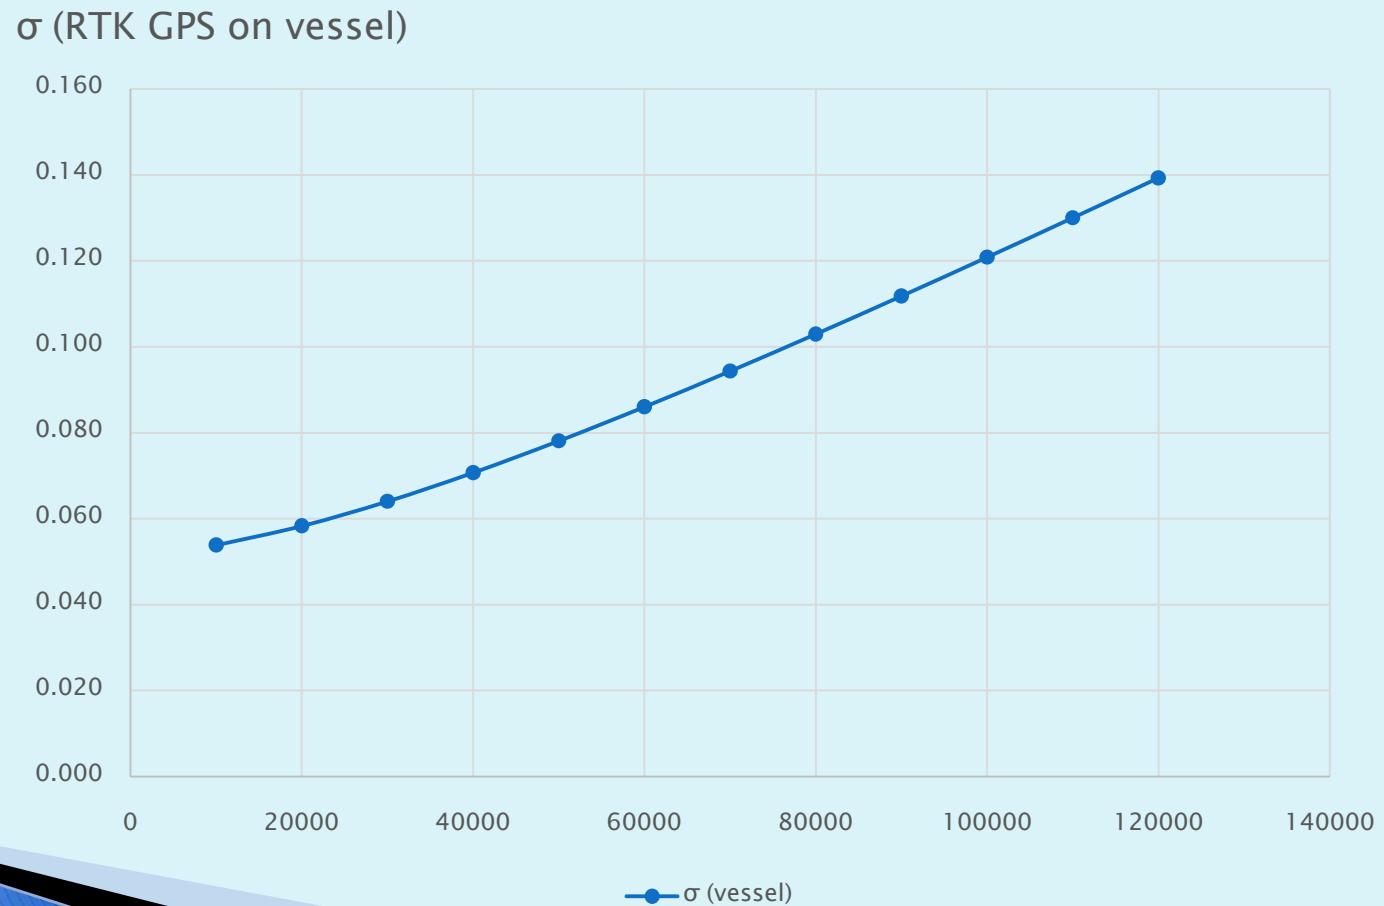

How precisely must all this be known?

- ❖ Breakdown into its separate components
 - ❖ GPS precision
 - ❖ Roll, pitch and gyro angles
 - ❖ Offset value precision

GPS precision

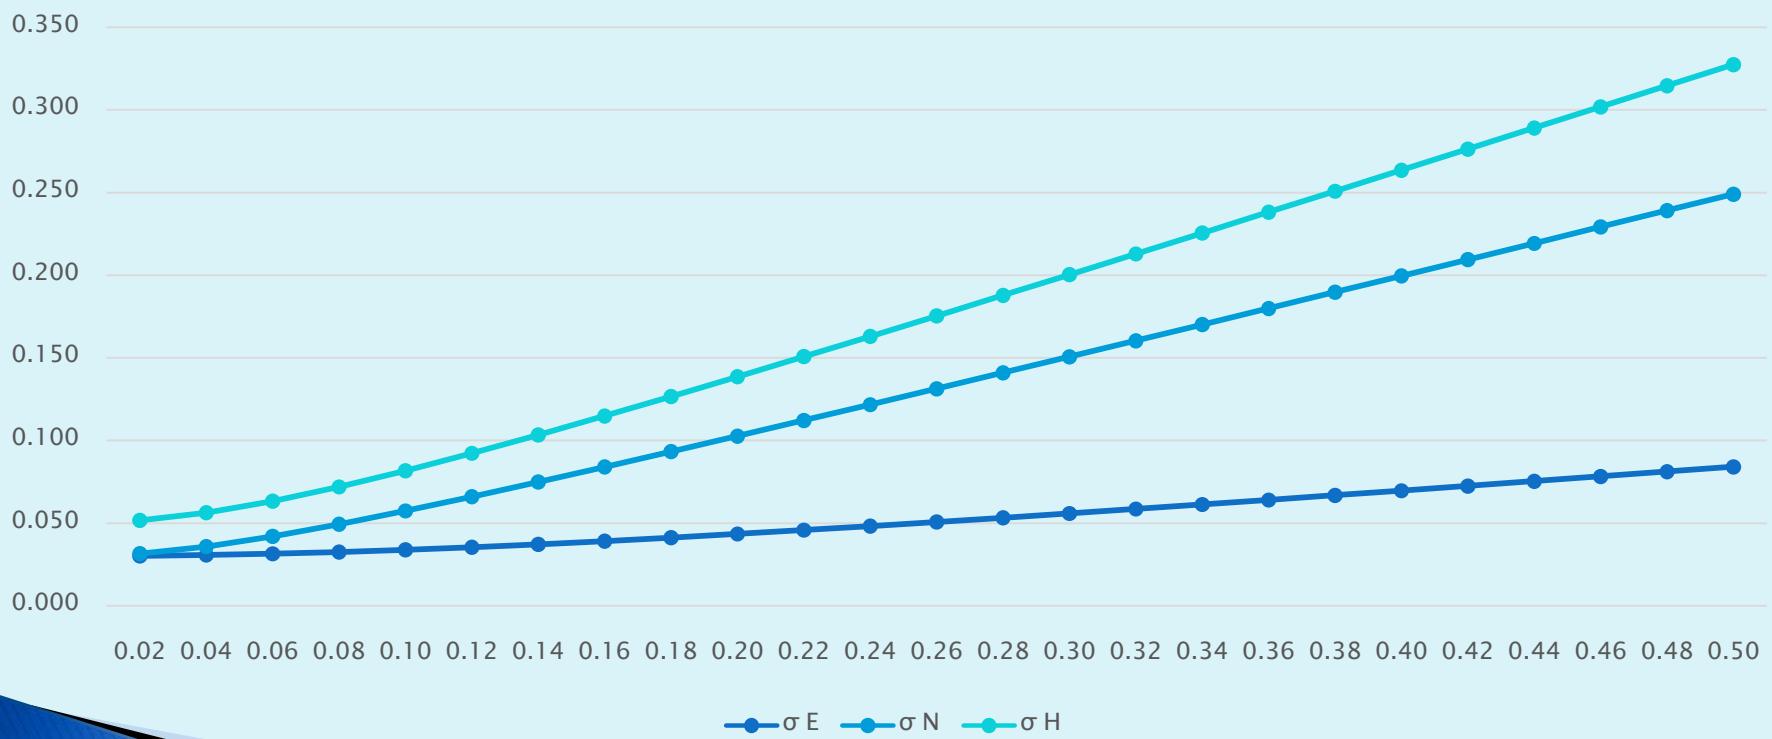

- ❖ RTK GPS vs satellite broadcast correction service

Effect of roll, pitch and gyro error

- ❖ Effect of MRU precision
- ❖ Effect of heading precision

Effect of roll, pitch and heading for a set of XYZ offsets

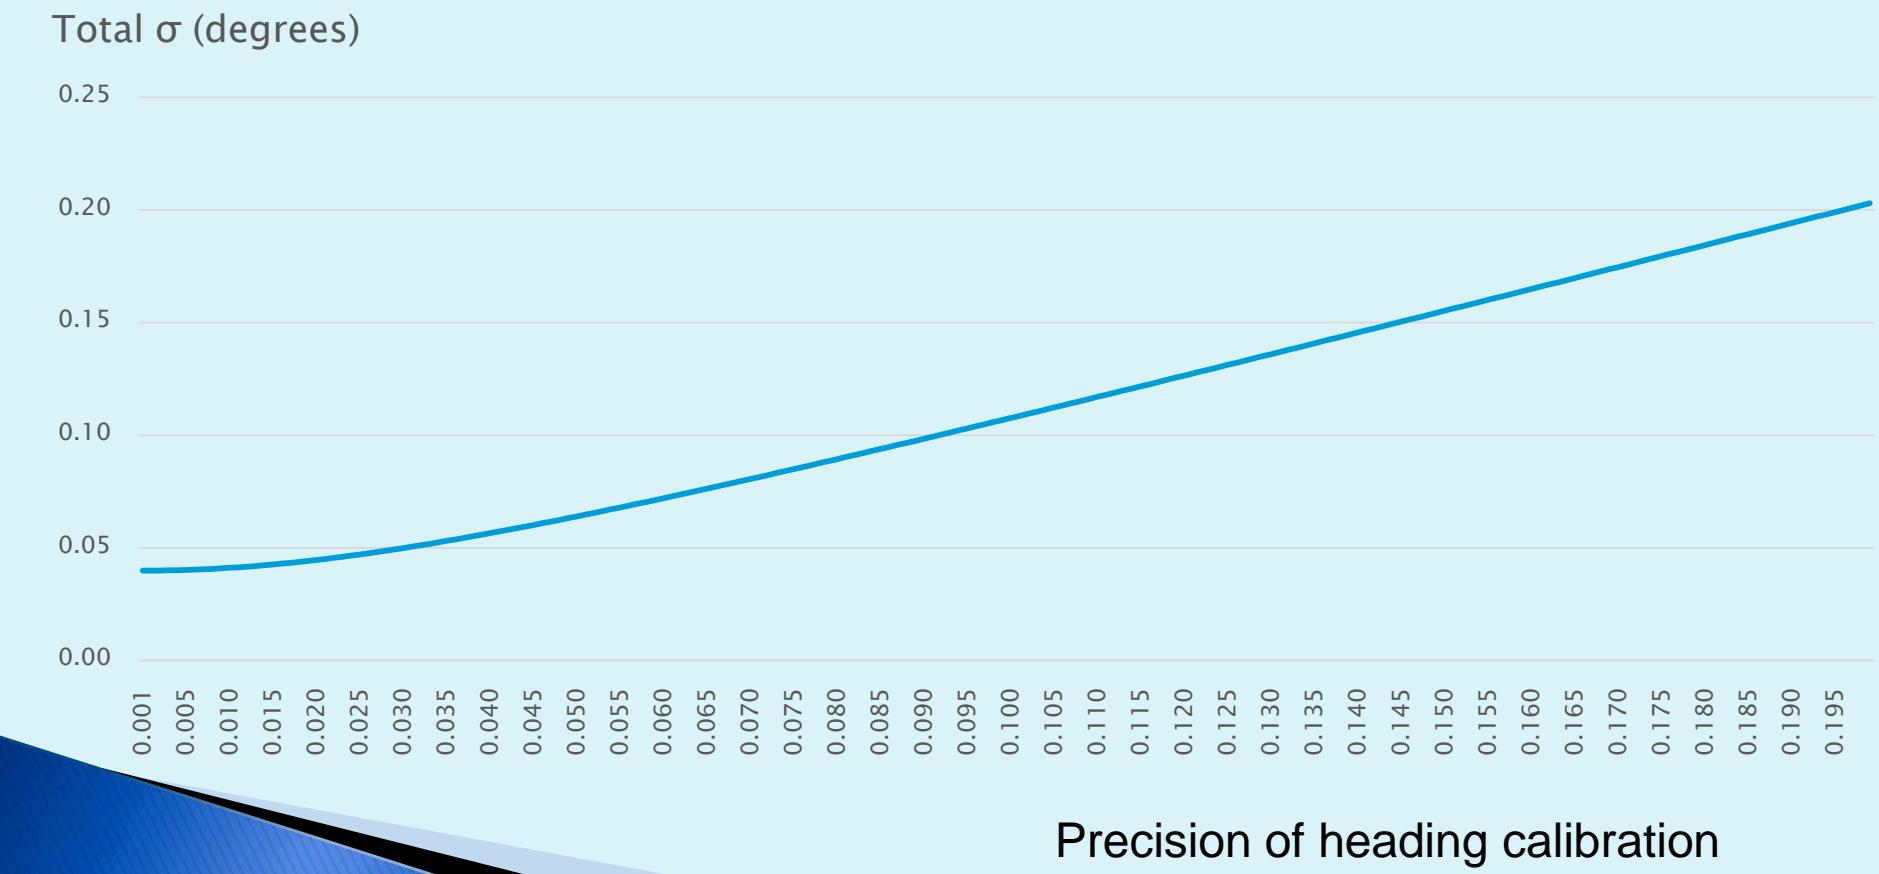

Attainable heading calibration

	ABC	
$\sigma^2(AB) = \sigma^2(CE) + \sigma^2(B) + \sigma^2(C)$	0.00019900	
$\sigma(AB)$	0.01411	.

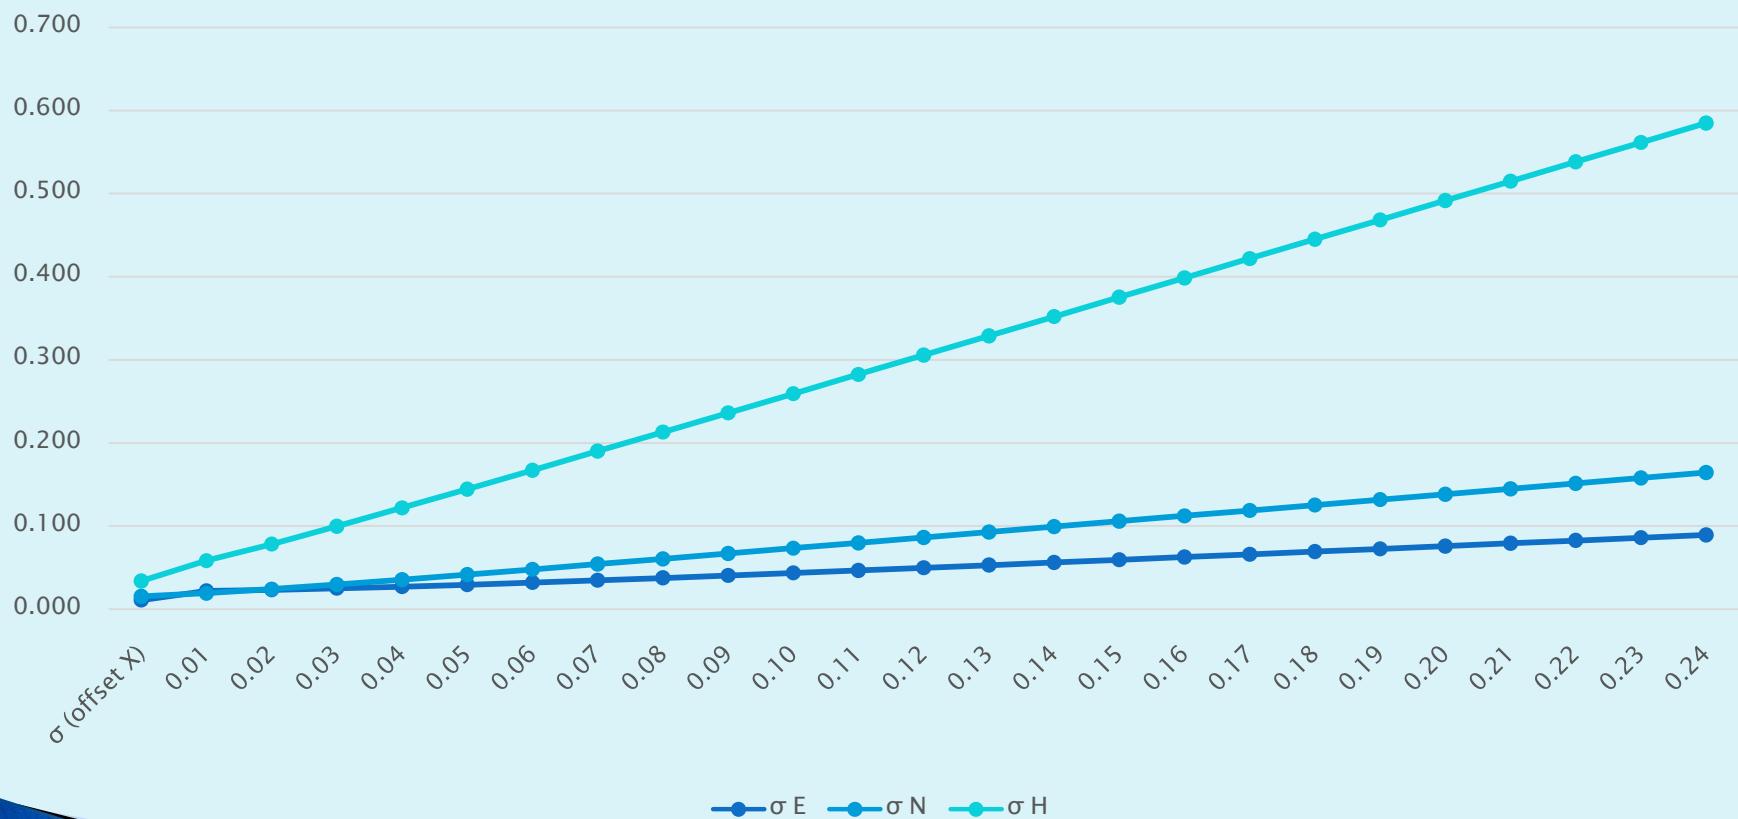

How precise?

- ❖ How precisely must the heading value be determined so that the gyro's precision is not degraded?

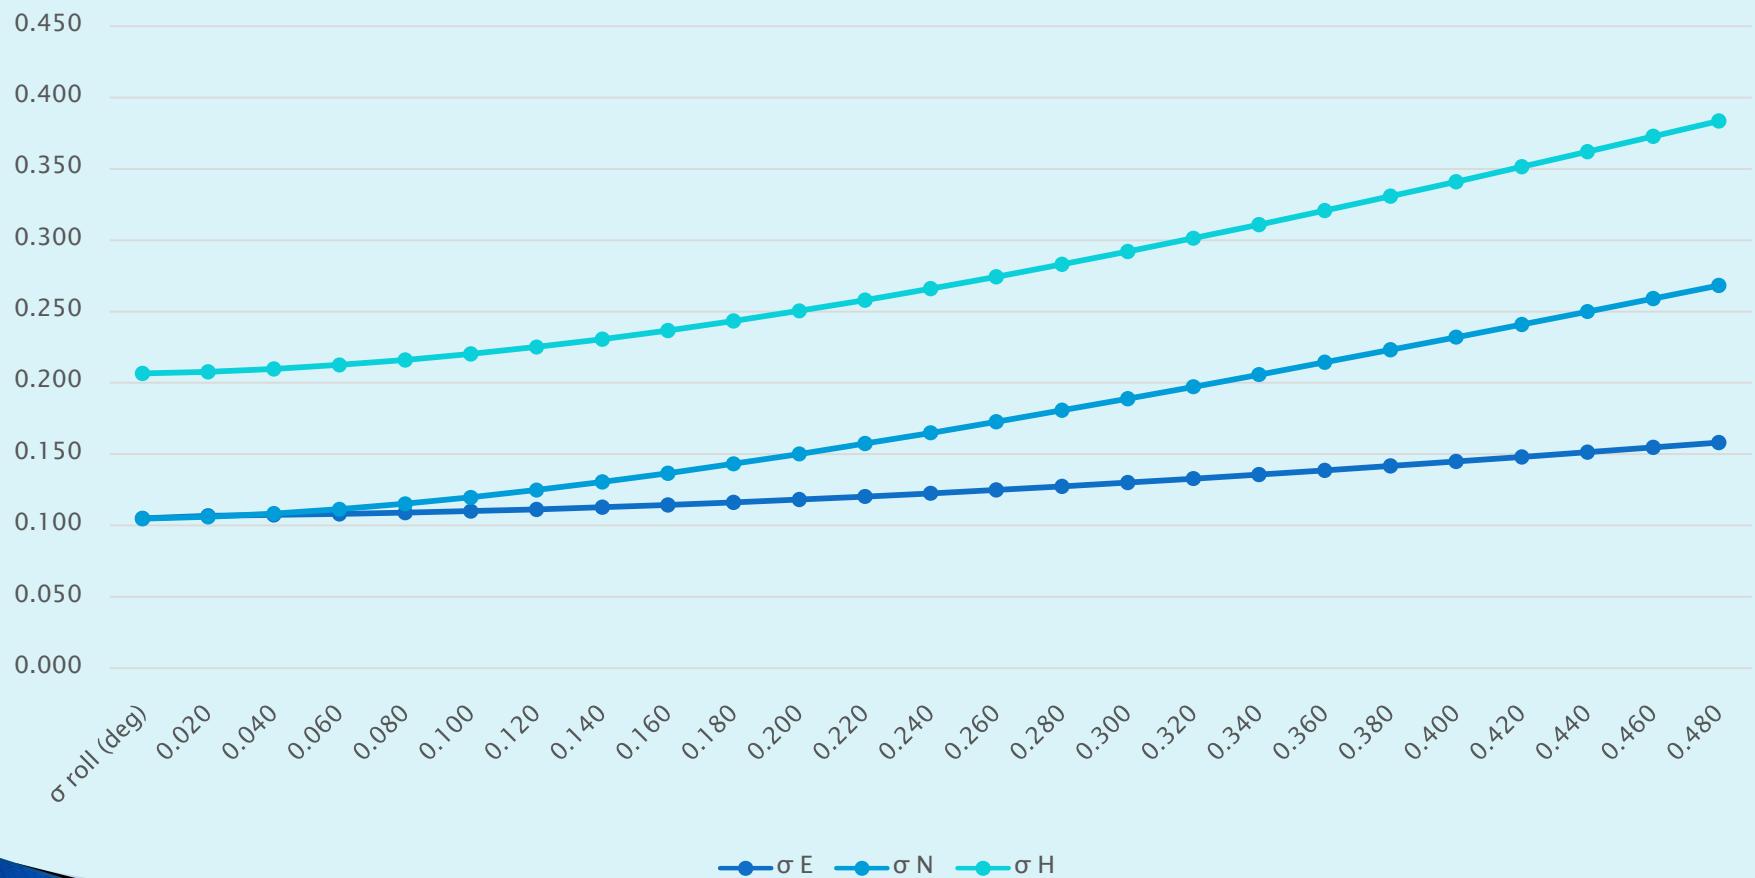

Effect of offset error

Effect of offset precision

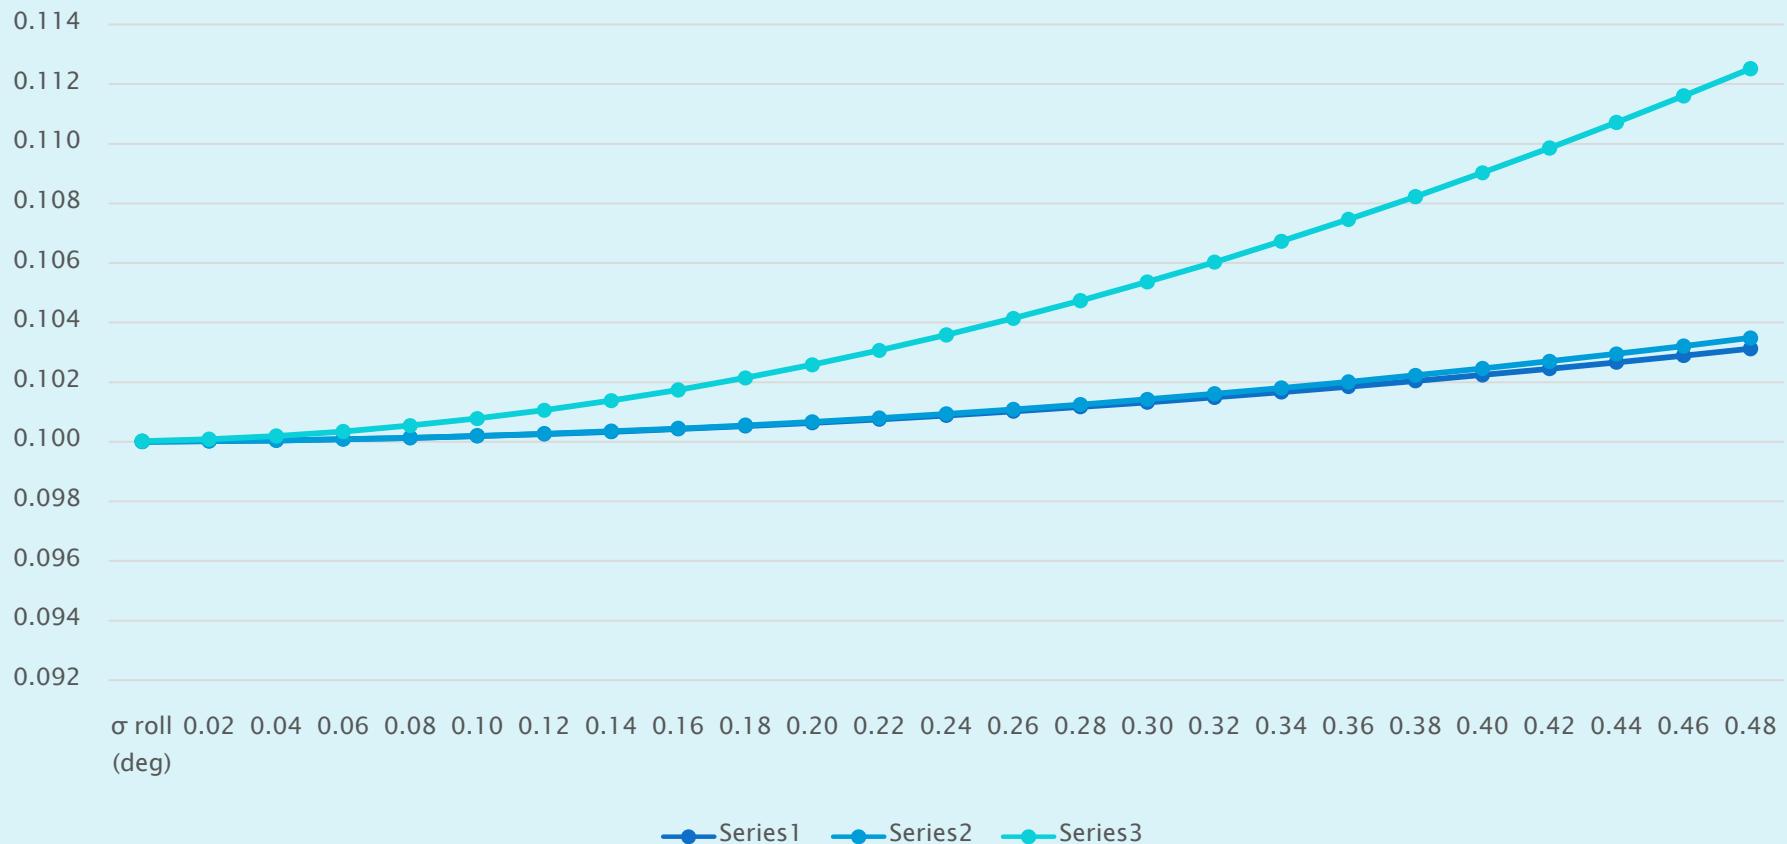

Combined effect

❖ Precision of the reference centre's position

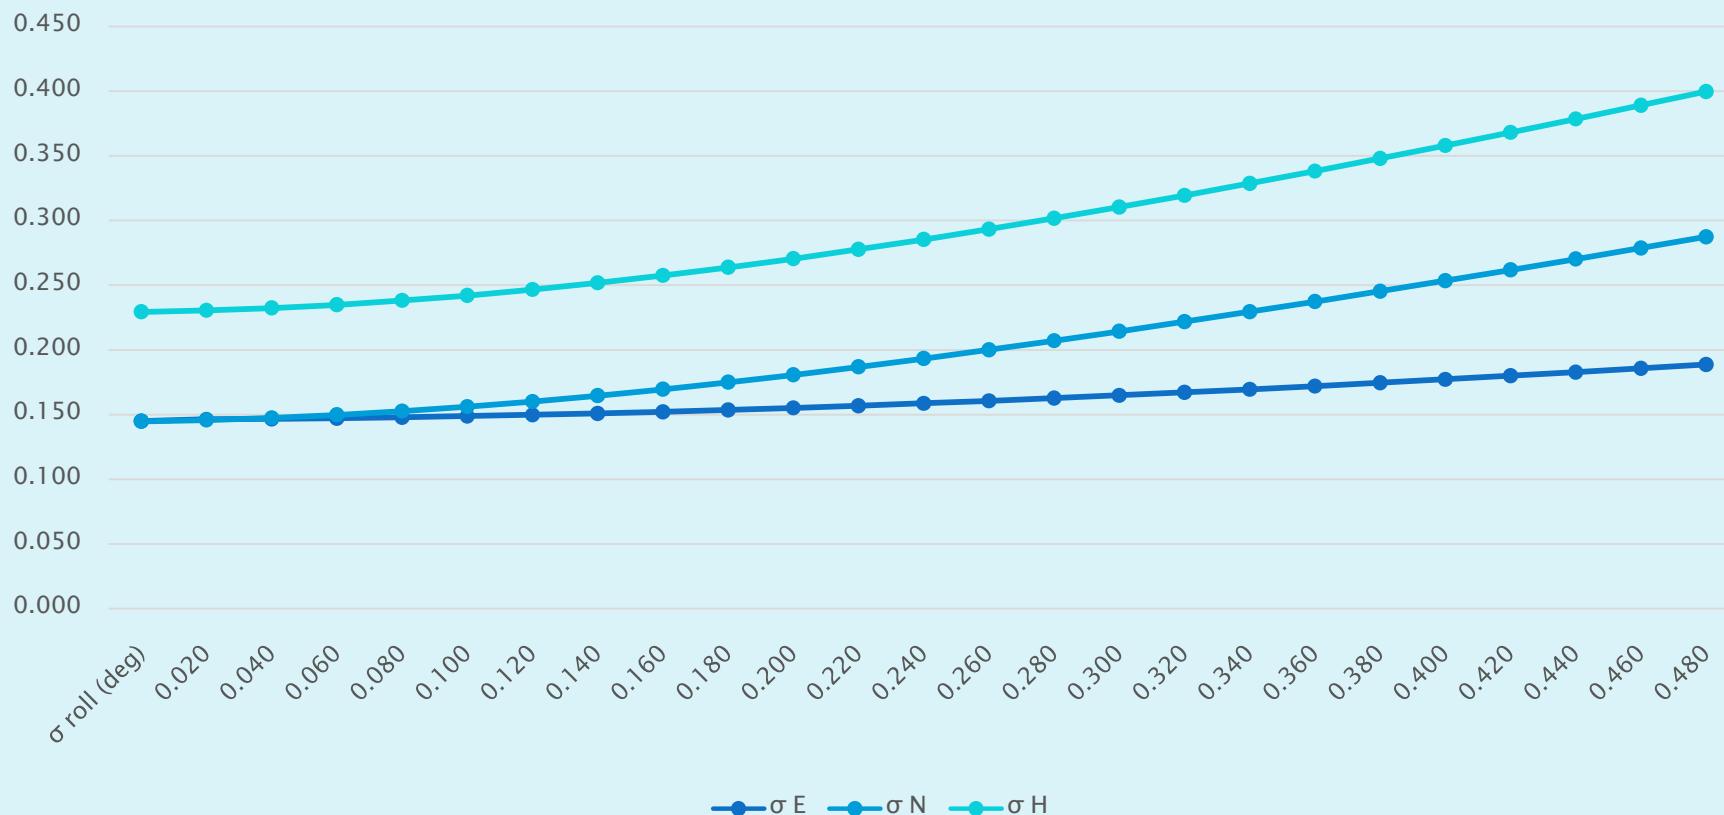

Acoustic precision

Effect of roll, pitch, heading on acoustic position for a set of offsets and ranges

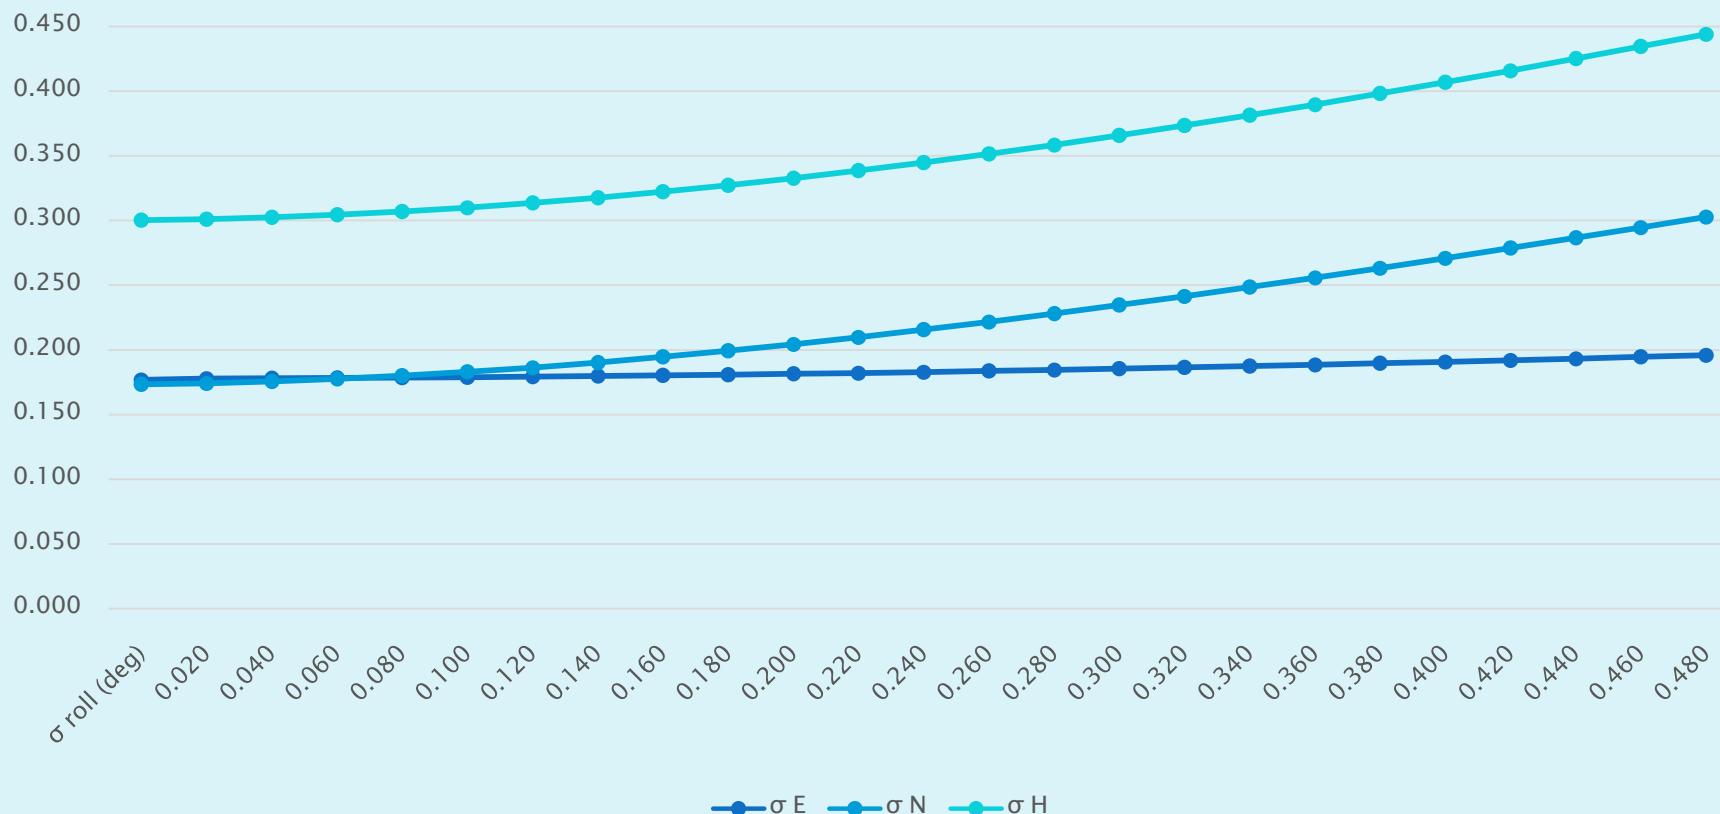

Overall combined effect

Precision of the final position: – 0.03; 0.03; 0.06 offset error

Effect of degraded offset precision

Precision of the final position: 0.10; 0.10; 0.20 offset error

Conclusion

- ❖ Position of geological sampling
- ❖ Sampling tool is much larger than the errors
- ❖ Requires geostatistical calculations to determine limit.

Thank you
